Xebia

Creating Xebia slides (theme) for AI + Marp

Maurits van der Schee

3 W's: Why, Why, *Why?!*

- No technical knowledge needed
- Prevent ugly deck creation
- Better deck contents with AI

Core Idea	Best For	Strengths	Limitations
Reveal.js HTML/ Markdown presentation *framework*	Highly customized, interactive slide decks	Huge plugin ecosystem, deep customization, code highlighting, non-linear	Requires HTML/CSS + JS knowledge for advanced use
Impress.js CSS3-powered 3D, zooming, non-linear	Prezi-style storytelling	Unique 3D transitions, flexible spatial layouts	Steep learning curve, fewer "traditional" slide features
Slidev Markdown + Vue-powered slides	Developer talks, live coding, interactive components	Vue components, Shiki highlighting, animations, recording, presenter mode	Requires Node/Vite/ Vue ecosystem familiarity
Marp Markdown → PDF/HTML/PPTX converter	Simple, fast, version-controlled slide creation	VS Code integration, theme engine, zero setup	Less interactive, fewer advanced animations

Exercise 1

- Install VSCode with the Marp extension
- Install Claude Code or Copilot
- Add the recommended .vscode/settings.json
- Ask AI to make a deck
- export to HTML/PDF/PPTX

Exercise 2

- Have Git and GitHub access to xebia/marp-slide-theme
- Clone the repo and run `npm install @marp-team/marp-cli`
- Run the debugger: `nodejs marp-debug.js slides.md` (see README)
- Do a PR to change the quote text color
- Think of new slide layouts (see slidev repository)
